

Individual Log – Sprint 2

Hugo Moslener 40241091

Date	Time (min.)	Task
02/13-02/14	360	Implement channel messaging feature. Setup the database to fetch all previous messages from a channel and to store messages sent in the current session so that others can see messages. Also made sure to make it so that when users send a message and their previous sent messages the message shows up on the right side of the message screen. It was my first time working with backend which is demonstrated with how much time it took.
02/14	60	Modify and implement globalAdmin code so that admins can see every team and channel messages. This required to add a clause in the fetch channels and teams to check for the globalAdmin variable associated with users.
02/19	80	Allow admins to add users to existing channels. Created a button that brings up a widget to select a user that was not already part of a channel.
02/20	120	Implement a local admin feature that sets users to localAdmins when they create channels within teams, made sure to restrict their power to that channel only, backend.
